

Automated Network Request Management in ServiceNow

Idea Prioritization

Date	08 September 2026
Student Name	Vijjapu Madhuri
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	

Idea Prioritization

The prioritization below focuses on the core components of the Automated Network Request Management project — the Service Catalog submission, the automated flow, the approval process, and the underlying data and security model. Each component is rated High or Medium based on its importance to the project's business objective, its feasibility, its role in automation, and its dependency on other components.

Idea Group / Feature	Purpose in Project	Priority	Reason for Priority
Network Request Service Catalog	Provides a Service Catalog item under the Network category where users can raise requests for new or existing network connections.	High	Acts as the main starting point for network-related requests and makes the submission process more organized, quick, and dependable.
Network Request Form and Variables	Collects important request information such as Requested For, Mobile Number, Connection Type, Existing ID, Total Amount, Mode of Payment, Address, and the Opened on Behalf Of variable set.	High	Ensures that all necessary information is captured during submission, helping reduce missing data, manual work, and processing errors.
Flow Designer Automation	Uses Flow Designer actions such as Get Catalog Variables, Create Record, Send Email, Ask for Approval, If/Else conditions, and Update Record after a catalog request is submitted.	High	Provides automated handling of the complete request lifecycle and forms the main automation component of the project.
Approval Routing	Sends submitted requests through the required approval process using the Ask for Approval action and Approval Request related list, while maintaining the Approval Status in the Network Database record.	High	Creates a consistent and traceable approval mechanism before the request is fulfilled and helps satisfy approval and compliance requirements.
Network Database Record Creation	Automatically creates a Network Database record containing details such as Database Number, Assignment To, Mobile Number, Total Amount, Mode of Payment, Connection Type, Customer Address, Approval Status, and Requested For.	High	Provides a central record for the IT Admin and Network Fulfilment Team to manage, monitor, and complete network-related requests.
Dynamic Form Behaviour	Uses a Catalog UI Policy to display the Existing ID field only when the user selects Existing as the Type of Connection.	Medium	Makes the form more relevant and improves the accuracy of information collected, but it is an additional enhancement rather than a core requirement.

Email Notifications	Uses the Send Email action in the automated flow to notify the appropriate stakeholders about request-related updates.	Medium	Improves communication and keeps relevant users informed, although the main request process can operate without this feature.
Request Tracking / Status Visibility	Allows users to identify the current status of a request through the Approval Status field maintained in the Network Database record.	Medium	Provides useful visibility into request progress, but it relies on the Network Database record being available first.
Access Control	Applies default ACLs and Access Control Rules to the Network Database table to control read and write access to sensitive information according to user roles.	Medium	Helps protect important data and supports security requirements, but this functionality depends on the Network Database table being established.
Validation and Testing	Verifies mandatory fields, automatic data population, approval states, and the complete workflow through unit testing, end-to-end testing, and User Acceptance Testing.	Medium	Ensures that the system works correctly and reliably before deployment, but testing is mainly performed after the primary features have been implemented.

Idea Group / Feature	Purpose in Project	Priority	Reason for Priority

Prioritization Overview

The card view below summarizes each project component alongside its assigned priority level.

Network Request Service Catalog	High
Network Request Form and Variables	High
Flow Designer Automation	High
Approval Routing	High
Network Database Record Creation	High
Dynamic Form Behaviour	Medium
Email Notifications	Medium
Request Tracking / Status Visibility	Medium
Access Control	Medium
Validation and Testing	Medium
